Recap: Unit 6

Computers & Hardware

A computer follows Input → Process → Output. Hardware = physical parts you can touch.

Software

System Software manages the computer. Application Software helps the user do tasks.

Input & Output Devices

Input sends data in. Output gives results out. Some devices do both.

Storage

Primary storage (RAM) is temporary. Secondary storage (HDD/SSD) is permanent.

? Quick check: what TYPE of software is an Operating System — System or Application?

Today's Objectives

Define the OS

Explain what an Operating System is and why every computer needs one.

Know What It Does

Describe how the OS runs apps, manages memory, and saves files.

Compare Systems

Compare Windows, macOS, Linux, Chrome OS, Android and iOS.

Get Hands-On

Find your Windows version and pin an app to the taskbar.

 We'll close with 2 hands-on labs and a class poll — keep these four goals in mind.

UNIT 07

Operating Systems

What they are and how we use them.

What is an Operating System?

The operating system (or “OS”) is the main software on your computer. It is the first thing that runs when you turn your PC on.

A Simple Bridge

It sits between you and the hard computer parts so they can talk to each other easily.

The Big Helper

It runs your apps, saves your files, and handles your mouse and keyboard clicks.

The Office Manager

Think of it as a manager in a busy office who stops programs from bumping into each other.

What does the OS do?

Running Apps

Starts your apps, runs them safely, and closes them when you are finished working.

Managing Memory

Divides computer memory (RAM) among programs so your computer does not freeze.

Saving Files

Keeps your files and folders organized on the storage drive so you can find them later.

Popular Computer Systems

System	Maker	Where It Runs	Why People Use It
 Windows 10 / 11	Microsoft	Most standard Laptops and PCs	Very easy to use and works with almost all software.
 macOS	Apple	Only on Apple Mac computers	Great for design work, looks beautiful, and runs smoothly.
 Linux	Open Source	Web servers and programmers	It is completely free to use, safe, and can be customized.
 Chrome OS	Google	Lightweight Chromebooks	Starts very fast and works mostly with internet apps.

Phone Operating Systems

Android (by Google)

This is the software used on most smartphones around the world.

Runs on many phone brands like Samsung, Vivo, and Oppo.

Lets you change the screen look, colors, and settings easily.

iOS (by Apple)

This is the software made only for Apple products.

Works only on iPhones and iPads.

Highly secure system that runs very fast and smoothly.

How a Computer Starts Up

1

Power On

You push the power button.
Power flows to the computer parts.

2

Self-Test

The system runs a quick check to
see if the hardware parts are
working.

3

Load OS

The system copies files from the
hard disk to the main memory
(RAM).

4

Ready!

The welcome screen loads up.
You can now start using your
computer.

Lab 1 — How to Find Your Computer Info

Lab 1 of 2

 **Goal:** Find out which version of Windows you are using.

1

Step 1

Click the Windows Start button at the bottom left.

2

Step 2

Open Settings, go to System, and click About.

3

Step 3

Look down the screen to see your system details.

Lab 2 — How to Pin Apps to the Taskbar

Lab 2 of 2

 **Goal:** Put your favorite apps on the taskbar so they open with a single click.

Step 1

1

Open the Start menu and search for the app you want.

Step 2

2

Right-click the app name to open the options list.

Step 3

3

Click on "Pin to taskbar". The icon is now locked on your bar!

Unit 7 Quiz: What Computer Systems Do You Use?

Discuss with your class — what computer systems you use every day!

On Your Laptop

What operating system runs on the main computer you use at home?

On Your Phone

What operating system runs on the smartphone you carry every day?

Key Takeaways

What is an OS?

The main software that runs first when you turn on your PC. It's the bridge between you and the hardware — the “office manager” that keeps everything running smoothly.

What It Does

Runs your apps, manages memory (RAM) between programs, and keeps your files organized on storage — all at the same time, without you noticing.

Popular Systems

Windows (most PCs), macOS (Apple only), Linux (free & customizable), Chrome OS (lightweight). On phones: Android (Google, many brands) and iOS (Apple only).

How It Starts Up

Power On → Self-Test (checks hardware) → Load OS (copies files to RAM) → Ready! (welcome screen appears). This all happens in seconds.

Next up — Unit 8: Windows Desktop

What You Learned Today

Labs 1 & 2 complete — everything from this lesson in one place.

OPERATING SYSTEMS — REFERENCE

What is an OS?

The main software that runs first when you turn on your PC — the bridge between you and the hardware.

3 KEY JOBS

- Running Apps
- Managing Memory
- Saving Files

BOOT SEQUENCE

Power On → Self-Test → Load OS → Ready!

Desktop Systems

Windows

Microsoft — most PCs

macOS

Apple — Mac only

Linux

Free & customizable

Chrome OS

Google — Chromebooks

Mobile Systems

Android (Google)

Many phone brands — Samsung, Vivo, Oppo. Customizable.

iOS (Apple)

iPhones and iPads only. Secure, fast, and smooth.

QUICK REMINDER

Settings → System → About shows your Windows version. Right-click any app → Pin to taskbar.

The OS is the bridge between you and your hardware — it runs apps, manages memory, and saves your files.
