Recap: Chapter 4

1

Alignment Sets the Tone

Left, center, right, and justify each send a different visual signal. Pick one on purpose.

2

Spacing Improves Readability

Line spacing and paragraph spacing are two separate settings — both matter.

3

Indents Show Structure

First-line and hanging indents signal different things — use the right one for the job.

4

Borders Draw the Eye

A border or shading highlights a paragraph — but only works if used sparingly.

Preview

Today's Objectives

1

Create Bulleted Lists

Turn any set of lines into a clean bulleted list when order doesn't matter.

2

Create Numbered Lists

Turn steps or rankings into an automatically numbered list.

3

Build Multilevel Outlines

Nest sub-points inside main points to show structure at a glance.

4

Customize List Styles

Change bullet symbols, number formats, and list indents to fit the document.

Bulleted Lists

1

The Bullets Button

Home tab → Bullets (or Ctrl+Shift+L) — turns selected paragraphs into a bulleted list.

2

When to Use Bullets

Best for items with no particular order — features, ingredients, supplies.

3

Changing the Bullet Style

Click the dropdown next to the Bullets button to pick a different symbol.

4

Ending a List

Press Enter twice, or press Enter then Backspace, to stop adding bullets.

Numbered Lists

1

The Numbering Button

Home tab → Numbering — turns selected paragraphs into a numbered list.

2

When to Use Numbers

Best for steps, rankings, or anything with a specific order.

3

Restart or Continue Numbering

Right-click a number to restart at 1 or continue from the previous list.

4

AutoCorrect Lists

Typing “1.” then a space automatically starts a numbered list — a fast shortcut.

Multilevel Lists

1

What Multilevel Means

A list with sub-points nested inside main points — like an outline.

2

Press Tab to Go Deeper

Tab moves a line deeper. Shift+Tab moves it back up.

3

The Multilevel List Button

Home tab → Multilevel List — offers ready-made outline styles.

4

Keep It to 2–3 Levels

Too many nested levels get hard to follow — stop at two or three.

Customizing List Style

1

Define New Bullet

Bullets dropdown → Define New Bullet lets you pick a custom symbol or picture.

2

Define New Number Format

Numbering dropdown → Define New Number Format changes the style, e.g. 1), a), i).

3

List Indent

Drag the ruler markers to adjust how far a list sits from the margin.

4

Convert List to Text

Select the list and click Bullets/Numbering again to turn it back into plain paragraphs.

PRACTICE

Make a Supplies List

1

Type the Items

Type these four lines, one per line: “Notebook,” “Pen,” “USB Drive,” “Ruler.”

2

Turn It Into Bullets

Select all four lines and press Ctrl+Shift+L.

3

Change the Bullet Style

Click the Bullets dropdown arrow and pick a different symbol.

4

Add One More Item

Click at the end of “Ruler.” Press Enter. Type “Eraser.” It should get a bullet automatically.

PRACTICE

Write the Submission Steps

1

Type the Steps

Type these three lines: “Open your document,” “Check your name is on it,” “Save it as a PDF.”

2

Turn It Into Numbers

Select all three lines and click Numbering on the Home tab.

3

Insert a New Step

Click at the end of step 2. Press Enter. Type “Email it to your instructor.” It becomes step 3 automatically.

4

Restart the Numbering

Right-click any number and choose Restart at 1 to confirm where the option lives.

Wrap-Up

Key Takeaways

1

Bullets = No Order, Numbers = Order

Pick based on whether sequence matters.

2

Tab Builds Levels

Tab and Shift+Tab move a line deeper or shallower in a multilevel list.

3

Word Renumbers Automatically

Insert or delete a step and the rest of the list updates itself.

4

Styles Are Customizable

Define New Bullet or Number Format gives full control over how a list looks.

Next up — Chapter 7: Page Setup & Layout
