

Browsing Internet & Manage Emails

Chapter 15 · Internet Safety

What We Cover Today

01 Internet Fundamentals

02 Web Browsers

03 Effective Browsing

04 Download & Upload

05 Browser Settings

06 Extensions

07 Bookmarks

08 Email Introduction

09 Creating Accounts

10 Email Settings

11 Composing Emails

12 Attachments

13 Managing Spam

14 Email Organization

15 Internet Safety

16 Cloud Storage

▲ TODAY

Recap: Chapter 14

1

Folders & Labels Both Work

Outlook and Yahoo use folders; Gmail uses labels.

2

Search Operators Save Time

from:, subject:, has:attachment, and after: narrow results fast.

3

Filters Automate the Boring Stuff

Label, forward, star, or delete emails automatically.

4

Good Etiquette Builds Trust

Respond promptly, stay concise, and skip ALL CAPS.

Quick check: name one thing you should never send over email.

Today's Objectives

1

Recognize Phishing & Scams

Spot fake login pages, scare tactics, and too-good-to-be-true offers.

2

Browse Safely

Check for HTTPS, and know the risks of public Wi-Fi.

3

Secure Your Accounts

Use strong passwords, a password manager, and 2FA.

4

Protect Your Privacy

Think before you share, and check your privacy settings.

We'll close with a 4-question recap — keep these four goals in mind.

CHAPTER 15

Internet Safety

Staying safe, private, and secure online

Recognizing Phishing & Scams

1

Fake Login Pages

Copycat sites that steal your username and password when you sign in.

2

Urgent, Scary Language

“Your account will be closed in 24 hours” pressures you to act fast.

3

Too Good to Be True

Prize winnings or free money you never entered to win.

4

Mismatched Links

Hover over any link first — the real URL often gives it away.

Rule of thumb: when in doubt, don't click — go to the site directly instead.

Safe Browsing Habits

1

Check for HTTPS

Look for the padlock icon before entering any personal information.

2

Be Careful on Public Wi-Fi

Avoid online banking or entering passwords on open networks.

3

Download from Trusted Sources

Stick to official sites and app stores, not random pop-ups.

4

Keep Software Updated

Updates often patch security holes that attackers exploit.

A padlock icon means the connection is encrypted — not that the site is trustworthy.

Passwords & Account Security

1

Use Strong, Unique Passwords

12+ characters, mixed case, numbers, and symbols
— never reused.

2

Try a Password Manager

Bitwarden or similar tools generate and remember passwords for you.

3

Turn On Two-Factor Authentication

A second step — SMS, app, or key — blocks most account takeovers.

4

Never Share Your Password

Not with coworkers, not over email or chat, not ever.

Reminder: you already practiced 2FA setup back in Chapter 9.

Protecting Your Privacy Online

1

Think Before You Share

Personal details posted online can be used to guess passwords or scam you.

2

Review Privacy Settings

Check who can see your posts, photos, and personal information.

3

Lock Your Device

A PIN or password stops others from accessing your accounts directly.

4

Log Out on Shared Computers

Especially in labs, cafes, or anywhere others use the same machine.

Your digital footprint is everything you've ever posted, searched, or shared.

Practice Exercise

1

Spot the Phish

Review a sample suspicious email and list 3 red flags you notice.

2

Check for HTTPS

Visit 3 different websites and check whether each shows a padlock.

3

Test a Password

Check the strength of a sample password using an online strength checker.

4

Review Your Privacy Settings

Open one social media or Google account and check who can see what.

Take 10 minutes — pair up if you'd like, then we'll review together.

Key Takeaways

1

When in Doubt, Don't Click

Go to the website directly instead of trusting a link.

2

HTTPS Is the Bare Minimum

It encrypts your connection — it doesn't guarantee trust.

3

2FA Is Your Best Defense

It stops most account takeovers even if a password leaks.

4

Privacy Settings Are Worth a Check

Review them on every account you use regularly.
